**Priority medicines required for child health and survival, but for which further research and development is needed**

**Tuberculosis**

Development of a product that will deliver these doses when given in 0.5 to 2.0 ‘tablets’ per day over the weight range 5-30kg. For example, a fixed dose combination containing rifampicin 250 mg, isoniazid 150 mg, pyrazinamide 400 mg and ethambutol 250 mg.

**HIV, TB prophylaxis, Pneumocystis carinii pneumonia**

Development of a fixed dose combination product of appropriate strength.

- **Isoniazid/co-trimoxazole**

**Neonatal care**

- **Apnoea**
  - Availability of a fully commercialized quality product in more countries; determination of the regulatory pathway; and dissemination of information on use.
  - **Caffeine citrate:** liquid 20mg/ml

- **Chlorhexidine gluconate:** solution, 4%

**Vitamin K deficiency**

Identification of optimal dose and strength of injection.

**Vitamin K**

- **make medicines Child Size**

**Priority medicines for mothers and children 2011**

Improving maternal and child health is a global priority. An estimated 8.1 million children under the age of five die every year and an estimated 1 000 000 women – most of them in developing countries – die every day due to complications during pregnancy or childbirth.

Many of these deaths are due to conditions that could be prevented or treated with access to simple, affordable medicines. However, the availability of medicines at public-health facilities is often poor.

This list of Priority Medicines for Mothers and Children was developed by the World Health Organization, UNFPA and UNICEF to help countries and partners select and make available those medicines that will have the biggest impact on reducing maternal, newborn and child morbidity and mortality.

**ENSURING ACCESS TO PRIORITY MEDICINES FOR MOTHERS AND CHILDREN IMPROVES HEALTH AND SAVES LIVES.**

Priority medicines for mothers
for major causes of reproductive and sexual health mortality and morbidity

**Post-partum haemorrhage** 1,2,3

Obstetric haemorrhage is the world’s leading cause of maternal mortality, causing an estimated 127 000 maternal deaths annually. Postpartum haemorrhage is the most common type and studies suggest that it may cause up to 50% percent of all maternal deaths in developing countries.

**Severe pre-eclampsia and eclampsia** 4,5

Pre-eclampsia and eclampsia are major health problems in developing countries. Every year, eclampsia is associated with an estimated 50 000 maternal deaths worldwide.

**Maternal sepsis** 2,4,6,7

Infection can follow an abortion or childbirth and is a major cause of death. Sepsis that is not related to unsafe abortion accounts for up to 15% of maternal deaths in developing countries. The majority of unsafe abortions take place in developing countries.

**Sexually transmitted infections** 8–11

Nearly a million people acquire a sexually transmitted infection, including the human immunodeficiency virus (HIV), every day. After pregnancy-related causes, sexually transmitted infections are the second most important cause of healthy life lost in women. The results of infection include acute symptoms, chronic infection, and serious delayed consequences such as infertility, ectopic pregnancy, cervical cancer, and the untimely deaths of infants and adults. Many sexually transmitted infections affect the outcome of pregnancy and some are passed to unborn and newborn babies.

**Preterm birth** 1,12–18

The incidence of preterm birth is approximately 6–7% of all births. Preterm birth is the leading cause of neonatal mortality both in developed and developing countries, accounting for an estimated 24% of neonatal deaths.

**Maternal HIV/AIDS and malaria**

See WHO guidelines 16,17

**Note**
The medicines on this list were chosen according to 1) the global burden of disease; 2) the evidence of efficacy and safety for preventing or treating major causes of sexual and reproductive, maternal, newborn and child mortality and morbidity. In addition, medicines were included for the prevention of pre-term birth and palliative care. All of the medicines listed are included in the current versions of the WHO Model List of Essential Medicines, the WHO Model List of Essential Medicines for Children 2009 and WHO treatment guidelines. All medicines on the priority lists are or may be available in countries with the exception of those which require further research and development.

---

Priority medicines for children under five years of age
for major causes of mortality 19 and morbidity, palliative care and child survival

**Pneumonia** 20–22

Pneumonia is the single biggest cause of death in children, killing an estimated 1.6 million children under the age of five years annually and accounting for 18% of all deaths of children under five years old worldwide.

**Diarrhoea** 23–24

Diarrhoeal disease is the second leading cause of death and a leading cause of malnutrition in children under five years old, killing more than 1.3 million children every year.

**Malaria** 14

Every 45 seconds a child dies of malaria in Africa. In 2008, there were 247 million cases of malaria and nearly one million deaths – mostly among children living in Africa.

**Neonatal sepsis** 20

One quarter of the estimated 3.6 million neonatal deaths around the world each year are caused by severe infections, and around 528 000 of those are due to neonatal sepsis alone.

**HIV** 25–27

An estimated 21 million children were living with HIV at the end of 2008. 1.8 million of them in sub-Saharan Africa. Most infections are the result of transmission from mother to child. Without effective treatment, an estimated one third of infected infants will have died by one year of age, and about half will have died by two years of age.

**Vitamin A deficiency** 28

Vitamin A deficiency is a recognized risk factor for severe measles. An estimated 164 000 people died from measles in 2008 – mostly children under the age of five.

**Palliative care and pain** 29

Although means to relieve severe pain are widely available, their use in children is often limited.
